

Systems Engineering Research Center (SERC)

Executive Overview

Dr. Dinesh Verma

November, 2016

This material is based upon work supported, in whole or in part, by the U.S. Department of Defense through the Systems Engineering Research Center (SERC) under Contract H98230-08-D-0171. The SERC is a federally funded University Affiliated Research Center (UARC) managed by Stevens Institute of Technology consisting of a collaborative network of over 20 universities. More information is available at www.SERCuarc.org

SERC Network of Over 20 Collaborators

SERC leverages expertise of over 450 researchers across the United States

Transition of the SERC Analytic Workbench Technology into Government Service by JHUAPL

14 November 2016

The Johns Hopkins University Applied Physics Laboratory (JHUAPL) is a University-Affiliated Research Center (UARC) and a non-profit organization with a long tradition of serving the US Government as a trusted agent. This role has enabled JHUAPL to develop extensive knowledge and relationships in multiple operational and security domains. JHUAPL is working with a government sponsor in one such domain to identify technology transition opportunities from research projects being conducted by the Systems Engineering Research Center (SERC). The SERC is also a UARC, consisting of a network of academic researchers across many US universities who primarily perform unclassified fundamental research on systems engineering methods, processes, and tools (MPTs). As mature SERC technology and appropriate government programs are identified, JHUAPL will work as a trusted technology transfer agent of the government, incorporating the technology and ensuring its benefits are realized in areas where the SERC has limited access to government programs and information.

Figure 1 represents an overview of the process by which JHUAPL will transfer technologies being developed by the SERC into use by government programs. Beginning on the left side of the figure, the process starts with the SERC producing MPTs across a spectrum of research interests. JHUAPL performs initial assessments of these MPTs to identify potential candidates, favoring more mature tools in a Technology Readiness Level (TRL) 4-5 range, as guided by government sponsorship. The process of identifying technology transfer candidate tools includes the identification of an APL technology transfer champion, a government project champion, a receptive government project, and a governance model to ensure attention to such things as intellectual property rights and security issues.

INDUSTRY AND GOVERNMENT FORUM

MODEL CENTRIC ENGINEERING

**May 26, 2016
WASHINGTON, DC**

**Creating a New Culture and
Ecosystem for Coordination and
Collaboration with Model-Centric
Design and Acquisition**

INTRODUCTION, BACKGROUND, AND CONTEXT:

Model-centric engineering can be characterized as an overarching digital and visual approach to engineering. It also involves integrating different model types with simulations, surrogates, systems and components at different levels of abstraction and fidelity across disciplines throughout the system or solution lifecycle. The use of such digital engineering technologies and model-centric engineering practices are advancing, and adoption is accelerating. While this is happening, a number of technical and business/acquisition model challenges remain. The current business models may not be appropriately aligned for acquisition in such a model-centric ecosystem. We as a community must discuss approaches to allow better collaboration, while nurturing competition with appropriate approaches to address Intellectual Property Protection, Government Data Rights, and a Collaborative Environment.

These digital technologies are changing how organizations are conceptualizing, architecting, designing, developing, producing, and sustaining. Some use model-centric environments for customer engagements, as well as design engineering analyses and review sessions. Some are integrating mission and system-level modeling and simulations originally created for design and development and expanding them into new cloud-like services enabled by the industrial Internet. Most organizations today have a unique capability realized by integrating commercial technologies and tools with their own innovations.

We need insights from key stakeholders in the “user community” on how to transform our engineering and acquisition culture in light of these advancements, how to align engineering and business/acquisition models. We want to explore ideas and concepts to improve the efficiencies and speed development, deployment, and sustainment of needed capabilities to the warfighter.

The purpose of this workshop is for key stakeholders in industry, government, and academia to converge and identify high-value “air gaps” that remain as hurdles in model-centric engineering, and that can be addressed through focused research and policy.

INTENT:

A discussion between key stakeholders and thought leaders on challenges, issues, concerns, and enablers for a transformation towards model-centric engineering.

A platform to share ideas on how we could collectively operate in a transformed world of model centric engineering in acquisition.

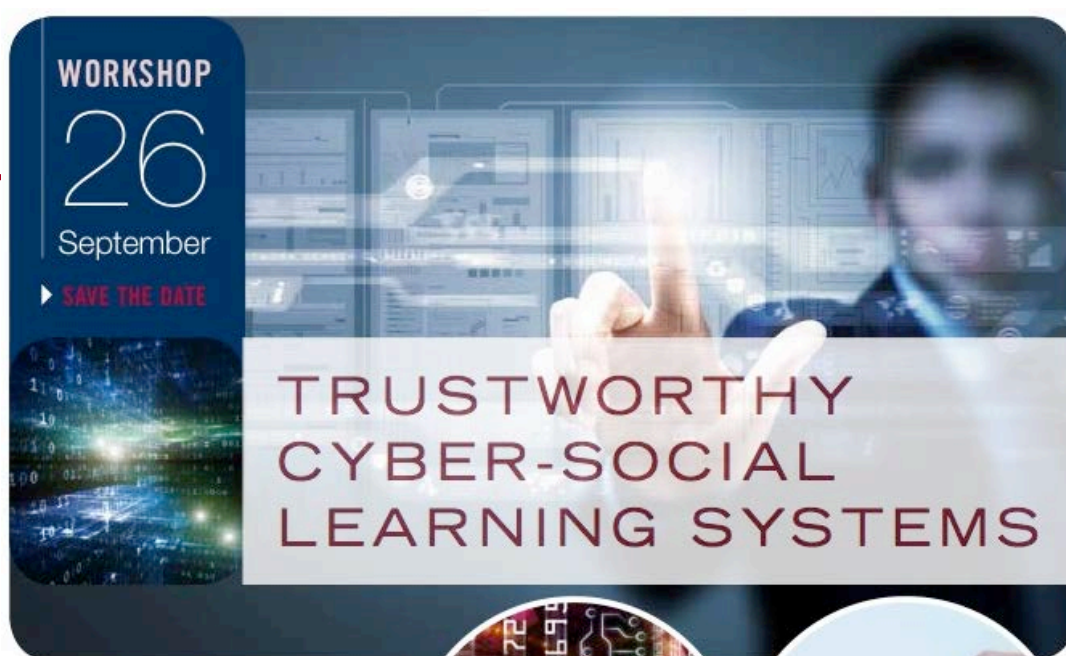

Presentations and demonstrations to reflect on enabling tools, technologies and concepts for new business models within such an ecosystem that facilitates coordination and collaboration.

AGENDA - SERC INDUSTRY & GOVERNMENT FORUM ON MODEL CENTRIC ENGINEERING

THURSDAY, MAY 26, 2016

8:00	Registration - Continental Breakfast	
8:30	Welcome & Announcements	
9:00	Forum Shaping Remarks (Ms. Kristen Baldwin)	
9:45	The Need for a Transformation - A Government Perspective (Mr. Dave Cohen)	
10:15	Break	
10:30	The Need for a Transformation - An Industry Perspective (Dr. Nicholas G. Paraskevopoulos)	
11:15	Panel: How Government Can Work Differently	
12:00	Lunch	
1:00	Breakout Session 1: A Collaboration Operational Model between Industry and Government (Moderated by Dr. Donna Rhodes, MIT)	Breakout Session 2: Roadmap of Technologies to Support a New Operational Paradigm in Model Centric Engineering (Moderated by Dr. Jon Wade, Stevens)
2:45	Break	
3:00	Current State of Research and Development in Support of Engineered Resilient Systems (ERS) (Dr. Jeff Holland, Chief Scientist, ERDC)	
3:45	Break	
4:00	Tools and Infrastructure in support of Model Centric Engineering - a Tool Vendor Perspective (Moderated by Mr. David Long, CEO, ViTech and Former President, INCOSE)	
5:00	Open Microphone and Additional Actions	
5:30	Social and Networking Session	

September 26, 2016;
Invitation only attendance,
limited to 35

FORTHCOMING**

ABSTRACT ▶

The looming integration of data-driven, artificially intelligent, semi-autonomous cyber-physical systems with people and social phenomena at scale presents new challenges and opportunities in systems engineering. The overall opportunity is to transform societal systems into *cyber-social learning systems* (CSLS): systems that integrate machine, human, and institutional perception, learning, reasoning, and acting to produce major improvements in socio-technical system function, performance, and fitness in complex, evolving, competitive, and hostile environments. Progress in CSLS science, engineering, and design will drive advances in all sectors, from defense to healthcare, education, and beyond. At the same time, CSLS present significant unresolved challenges in systems engineering. This workshop will focus on CSLS, in general, and on the need for advances to underpin the trustworthiness of mission- and safety-critical CSLS, in particular. Issues include but are not limited to allocation of responsibilities across human/social-machine boundaries; test and evaluation; accountable AI; system monitoring and control; systems safety for AI-infused cyber-social learning systems; and use of CSLS concepts, methods, and tools to improve the safety and trustworthines of existing systems.

MODULAR OPEN SYSTEMS APPROACH

MOSA:

TOWARDS COST EFFECTIVE ACQUISITION STRATEGIES

ABSTRACT:

As the DoD strives to affordably address emerging threats, it is challenged by issues such as component obsolescence, loss of critical suppliers, and planning technology insertion and upgrades for tightly coupled, highly integrated systems. The Office of the Deputy Assistant Secretary of Defense for Systems Engineering (ODASD(SE)) Modular Open Systems Approach (MOSA) initiative seeks to balance the business objectives with the technical means to meet these challenges through a modularization approach under the auspices of open systems architecture OSA. In this context, a critical set of new questions arise, at the holistic and localized levels that involve a diverse set of stakeholders across the acquisition life cycle.

Example questions include how to: 1) define modularity and openness contexts (technical and programmatic) in an ecosystem; 2) quantify the costs, benefits, and risks of modularization across multiple dimensions through tradespace exploration; and 3) identify compatible policies that can be used to capitalize on the positive aspects of modularization. Progress on these questions will ultimately provide decision-makers within the defense acquisition system to clearly identify opportunities for modularization, identify compatible architectural alternatives, promote system level innovations, reduce costs, and, most importantly, execute these within a decision-maker friendly framework that does not encumber the overall acquisition process with undue complexity.

This workshop will focus on exploring these questions. Participants will actively contribute to in-depth discussions on 1) defining, quantifying and assessing modularity and openness; 2) generating candidate strategies, cognizant of current barriers and potentially useful incentives; 3) synthesizing a key list of stakeholder needs and/or concerns across a MOSA ecosystem; and 4) mapping beneficial elements of modularization strategies to appropriate acquisition processes that encourage adoption. Participants will also assist in developing a useful repository of case studies (government/industry), including anecdotal evidence and lessons learned in the implementation of modular strategies.

**October 5, 2016;
Invitation only attendance,
limited to 35**

WORKSHOP - OCTOBER 5, 2016
8am – 5pm • Stevens Institute of Technology, Ronald Reagan Building, Washington D.C.
Workshop attendance is by invitation only.

LEADS:

- Dr. Daniel DeLaurentis**
– Purdue University
- Dr. Mitchell Kerman**
– Stevens Institute of Technology

Model Based Testing
Security at Design Time
Program and Acquisition Risk

Future Areas of SERC Research - DRAFT

- SE and SE Management Transformation
 - Model Centric Engineering
 - Flexible and Adaptive Systems
 - Architecting and Verification of Cyber-Human Learning Systems
 - Team Effectiveness
- Trusted Systems
 - Hard: Flexible Systems Architectures and Designs**
 - Wicked: Cyber Resilient Weapon Systems**
- **Scary: Autonomous Systems with varying levels of Cognition**
 - Leveraging MCE to enhance the innovation ecosystem supporting the DoD, modeling the Defense Innovation System
 - Understand enterprises and SoS to improve uptake of digital engineering/MCE and awareness of individual system developments
- Human Capital Development
 - Competency Identification
 - Mission Engineering Competencies
 - Competencies to support evolution of CPS and Autonomous Systems and MCE/Digital Engineering

SERC Doctoral Fellows Program

Human Capital Development: SERC Doctoral Fellows Program

- Started in 2012 as an evolution of SERC's unique research collaboration model
- Allows Ph.D. students at participating organizations to access our Collaborator Universities' leading systems thinkers as research advisors
- A key component of the SERC's human capital development mission in training the next-generation of our government and industry systems engineering thought leaders
- Current participants
 - First Commercial Organization: Boeing
 - First FFRDC: MITRE
 - First Warfare Center: ARDEC-Picatinny Arsenal

UPCOMING TOPICS:

SERC Talks features researchers from our Systems Engineering community sharing their insights on various questions relevant to Systems Engineering and its evolution. This series, stemming from the technical presentations which took place periodically during our SERC Collaborator WebEx meetings, will continue to grow and touch on other subjects and aspires to create an ongoing and more collaborative dialogue between academia, government and industry sectors. As always, SERC strives to grow Systems Engineering research into areas which can transition into impact.
