Big Data

Visual Analytics

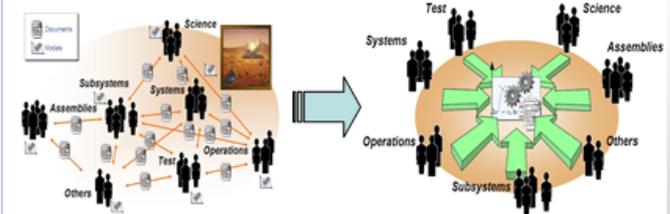

Complex Systems

Model-based Systems Engineering

Current Practice to Future Practice

International Workshop
25 Jan - 26 Jan 2014
Torrance, CA, USA

Gaspar, H., Rhodes, D.H., Ross, A.M., and Erikstad, E.O., "Addressing Complexity Aspects in Conceptual Ship Design: A Systems Engineering Approach" *Journal of Ship Production and Design*, Vol. 28, No. 4, Nov 2012, pp. 145-159.

http://www.omgwiki.org/MBSE/doku.php?id=mbse:incose_mbse_iw_2014

- Big Data + Visual Analytics...
 - + Complex Systems + MBSE = IMCSE
 - Volume, variety, velocity, and veracity of data
 - Collect data, visualize, interact, model, find patterns, generate insights, repeat
 - Structural, behavioral, contextual, temporal, and perceptual complexities
 - Integrated models including requirements, structure, behavior, parametrics
- Potential use for this merged capability for decision support within and across systems engineering throughout lifecycle

On the power of humans with computers:

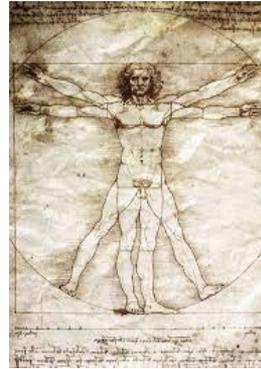

“statistics (computing) + humans is much more powerful than statistics alone or humans alone”

– Professor Remco Chang, Tufts University
Visual Analytics Lab, Aug 2013

Interactive Model-Centric Systems Engineering	MBSE	STRUCTURAL	form of system components and their interrelationships	Existing “state of practice” systems architecting and model-based systems engineering
		BEHAVIORAL	function/performance, operations, and reactions to stimuli	
	IMCSE	CONTEXTUAL	circumstances in which the system or enterprise exists	Emerging “state of art” <i>Epoch Modeling</i> <i>Multi-Epoch Analysis</i> <i>Epoch-Era Analysis</i> <i>Dynamic Tradespace Exploration</i> <i>Multi-Stakeholder Negotiations</i> <i>Comprehension of Complex Datasets</i> <i>Studies of Decision Making and more....</i>
		TEMPORAL	dimensions and properties of systems over time	
		PERCEPTUAL	stakeholder preferences, perceptions and cognitive biases	

Developing complex systems necessitates an approach to generate, manage, and analyze artificial data across these five aspects, which result in improved SE decision making

Systems scientists have long recognized that humans possess unique abilities for anticipation rather than simple reactive response

- Anticipation (ability to look forward in order to take a future decision or action)
- Pattern recognition skills
- Subject to cognitive limits, preferences, and biases...

Interactive Model-Centric Systems Engineering

Decision Science – Visual Analytics – MBSE

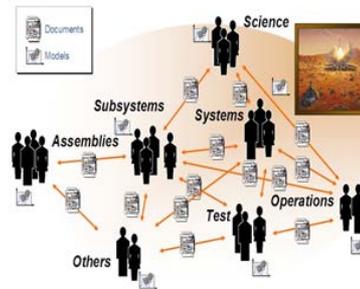

Anticipatory Capacity

Key Enablers

Mindset – systems thinking

Methods – model-based

Environment – hw/sw enhanced

- Complex, integrated models
- Varied levels of fidelity
- Large artificial data sets

Anticipatory Capacity is the capacity to continuously develop and apply knowledge acquired through a structured approach to anticipate: (1) changing scenarios as stakeholder needs and systems context change over time; (2) to consider their consequences; and (3) to formulate design decisions in response.

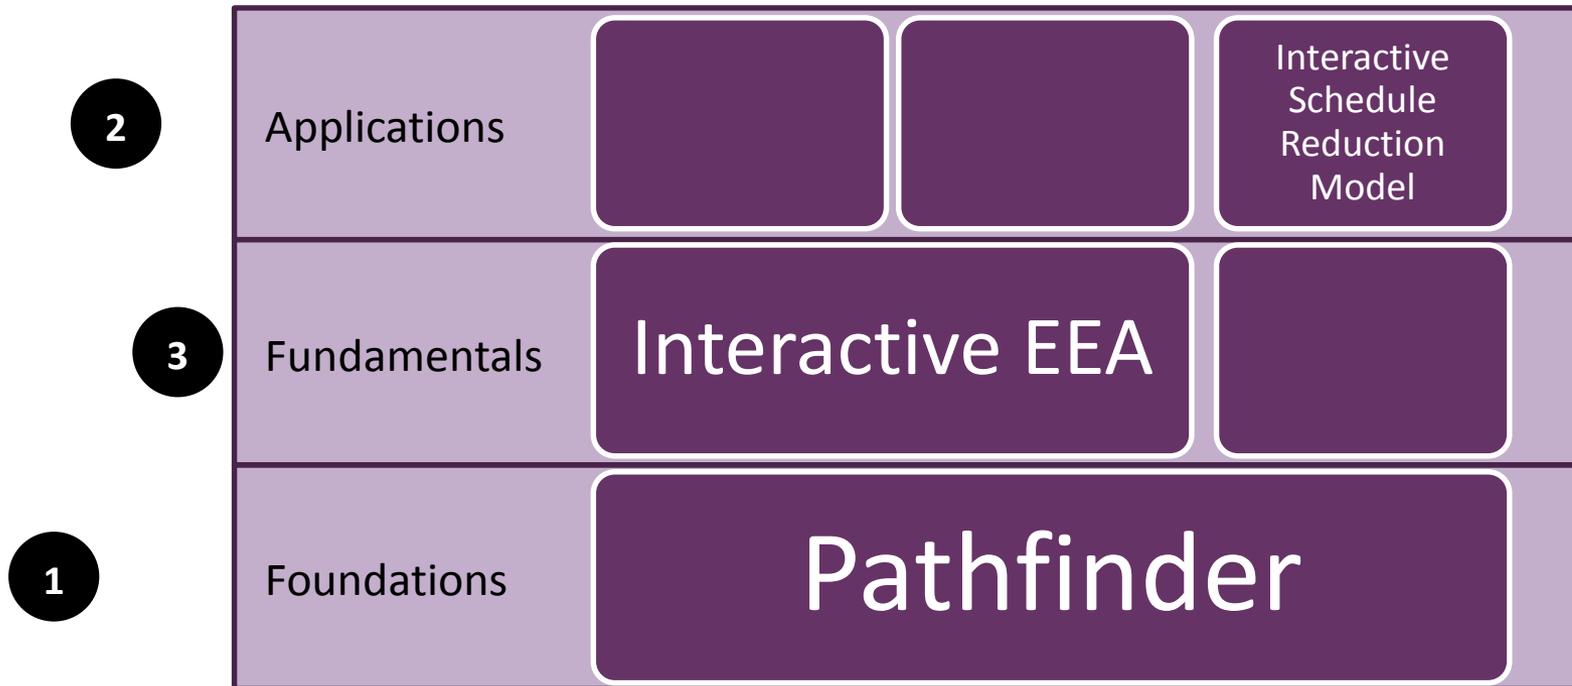

Rhodes, D.H. and Ross, A.M., "Anticipatory Capacity: Leveraging Model-Based Approaches to Design Systems for Dynamic Futures," 2nd Annual Conference on Model-based Systems, Haifa, Israel, March 2009.

- IMCSE will pursue a balanced basic and applied research approach
 - leveraging strengths of academic environment (e.g. fundamentals, rigor, neutral party view of problem), and
 - keeping the research relevant to the sponsor community, and
 - enabling opportunities for knowledge and MPT transfer to sponsors
- As the program matures, collaborations inside and outside of SERC

Knowledge Transfer Opportunities

Workshops, teleconferences and meetings, reports, papers, collaboration with other SERC activities, prototypes, MPTs, government partner applications, potential student internships

The IMCSE research program aims to develop transformative results through enabling intense human-model interaction, to rapidly conceive of systems and interact with models in order to make rapid trades to decide on what is most effective given present knowledge and future uncertainties, as well as what is practical given resources and constraints.

- To have most impact, IMCSE uses three complimentary thrusts with different timescales for impact
 1. Foundations: 1 year, set the stage for IMCSE
 2. Applications: 1 year, short timescale impact, deployment opportunities
 3. Fundamentals: multi-year, medium timescale impact, potentially broad applicability
- Following year one, we anticipate additional projects within applications and fundamentals, plus updates to foundations

- Progress on Three Thrusts

- Foundations: Pathfinder
- Applications: ISRM
- Fundamentals: IEEA

- Supporting MPTs

- Software: IVTea Suite
- Methods: Value Model Trading

- Emerging Challenges

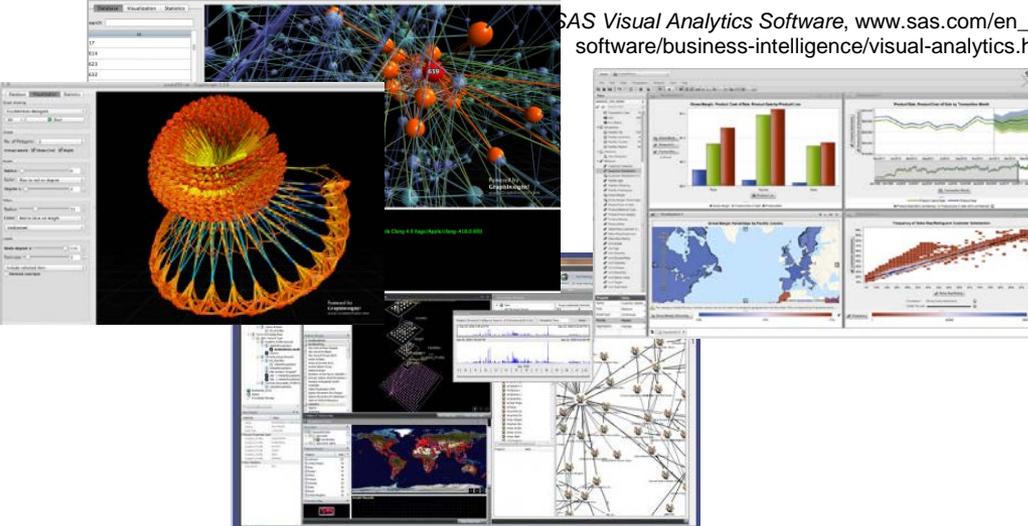

- Interactive tradeoffs of models
- Visual analytics of artificial (model-generated) data
- Perceptual and cognitive considerations in human-model interaction

Ultimately, the goal of IMCSE is to *leverage visual analytics applied to model-generated “big data,” in order to develop a rigorous framework, with associated methods, processes, and tools (MPTS), which will result in transformative new capabilities for complex systems engineering decision making.*

Enabling Software Tools

GI 1.3, www.graphinsight.com

SAS Visual Analytics Software, www.sas.com/en_us/software/business-intelligence/visual-analytics.html

Starlight Visual Information System, www.futurepointsystems.com

The Pathfinder project will focus on identification of past and present related state of art and practice, and will begin to build a community of interest around IMCSE

- **Lead:** Dr. Donna H. Rhodes, Dr. Adam M. Ross
- **Summary:** Investigation of state of art and practice, conduct of an invited workshop including SERC and selected outside entities
- **Example Anticipated Outcomes:** Workshop summary report, literature review, research agenda report

Model-Based
Systems Engineering
Center
<http://www.mbse.gatech.edu/>

<http://www.lboro.ac.uk/research/avrrc/>

<http://valt.cs.tufts.edu/>

<http://vacommunity.org/tiki-index.php>

- IMCSE Pathfinder project brings together the relevant stakeholders to develop a research vision and research priorities, and a roadmap to achieve them
- Activities include:
 - Investigation of the current state practice and emerging state of the art through literature review and discussions with subject matter experts
 - Face-to-face gatherings of stakeholders to define a research agenda
 - Initial small invited workshop at MIT on 20 Jan 2015
 - Tap into the broader research community to develop a collaboratively-derived research agenda
 - Building a community of interest and collaboration partners
 - Elucidation of challenge problems within IMCSE scope

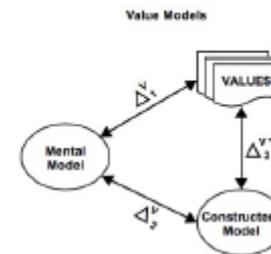

Big Data + Visual Analytics...
+ Complex Systems + MBSE = IMCSE

The ultimate goal is to build a community of interest around the IMCSE research agenda, establish partnerships for research, and to foster collaboration in addressing the emerging challenges at the intersection of the four pillars.

- Since every model is an abstraction from reality, it is important for any model user to understand the implications of embedded assumptions
- Sensitivity analyses should be performed whenever time and resources allow, yet in practice, many studies are resource constrained and therefore only cursory (if any) sensitivity analysis is conducted
- Since the assumptions in the models impact the results of those models, not only are choices of model parameters important from a “within” model sensitivity perspective, but also choice of the model itself can have large ramifications on results

Mental Model v. Values

		Low Δ_1 (truthful)	High Δ_1
Constructed Model v. Mental Model	Low Δ_2 (trust)	Correct Trust: Trust present. Correct representation of values.	Type I error: Trust present. Incorrect representation of values.
	High Δ_2	Type II error: Trust not present. Correct representation of values.	Justified Mistrust: Trust not present. Incorrect representation of values.

Preliminary research was done to trade “within model” sensitivities in value models, investigating the potential for interaction in refining value model parameter choices (Ricci et al. 2014)

IMCSE will seek to address the challenge of performing broad sensitivity analysis, in terms of model choice, as part of a given study, so that it is not relegated to a later activity that is subject to omission when resources are short

- Since the goal of visual analytics is to generate insights into relationships and patterns in the data, the existence of potentially confounding artifacts in the data makes it especially challenging when ground truth is no longer available
- This is essentially the difference between exploratory modeling and consolidative modeling:
 - **consolidative modeling** includes “techniques in which known facts are consolidated into a single model” in order to generate explanatory relationships of existing data
 - the intent of **exploratory modeling** is to “generate artificial data” that “can inform modelers and decision makers of the ramifications of various sets of assumptions, as well as provide consistent communication”

In IMCSE, models will tend to be of exploratory nature and therefore additional considerations must be taken into account when generating and visualizing the data in order to properly interpret the results

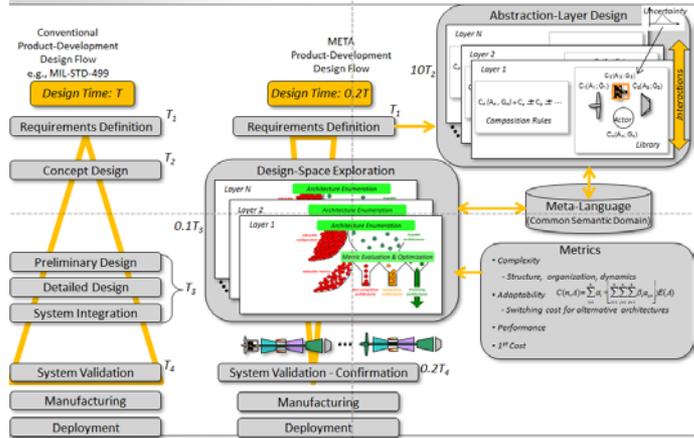

- *Human-Systems Integration* research has advanced the theory and methods concerning integration of humans and operational systems
- IMCSE is concerned specifically with interaction of humans with engineering models, and environments for human-model interaction
- Research from HSI and other fields informs IMCSE, but additional research is needed, for example: *investigating human cognitive and perceptual limitations as they impact interactions between users and predictive models:*
 - *behavioral over-reliance on cognitive biases in choice behavior*
 - *tendency towards ambiguity aversion;*
 - *limitations of affective forecasting when making projections*

In considering the form of visual analytics to represent big data, and the structure of model-based approaches to forecasting the evolving complexities of large-scale system, it is crucial to also consider the perceptual and cognitive capabilities of human beings at the center of these exploratory efforts

Just as basic human factors has evolved to a science of *human systems integration*, there is a need to evolve a science of *human-model interaction*

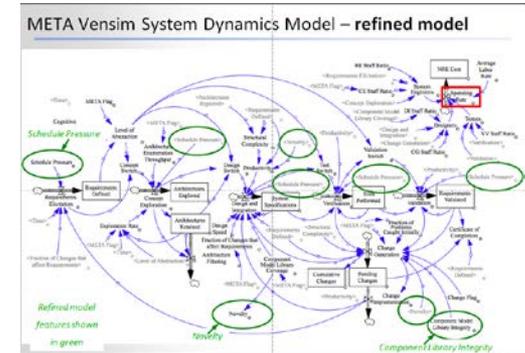

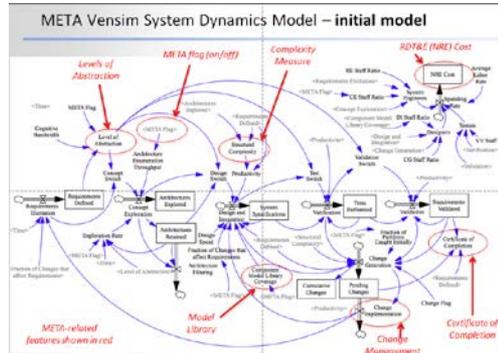

Complex Systems Design and Analysis – META Approach

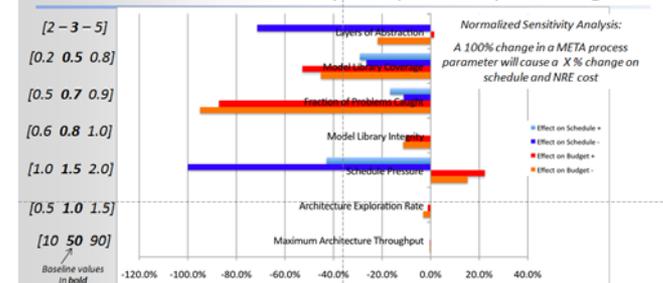

de Weck, O., "Feasibility of a 5x speedup in system development due to META design", ASME 2012 IDETC, Chicago, IL, Aug 12-15, 2012, paper DETC2012-70791.

Leveraging prior work from DARPA META, the Schedule Reduction Model will be extended with interactivity as a central aspect, promoting sensitivity analyses and benchmarking to be the central use case

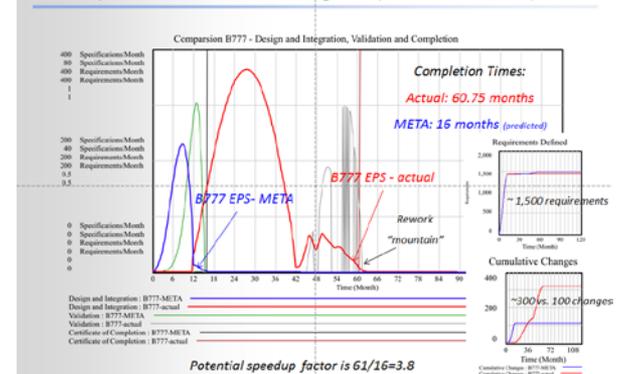

- **Lead:** Professor Olivier de Weck
- **Summary:** Exploratory extension of system dynamics-based Schedule Reduction Model, w/prototype model for pilot application
- **Example Anticipated Outcomes:** Report, Demo, Prototype, Potential Deployment Partner

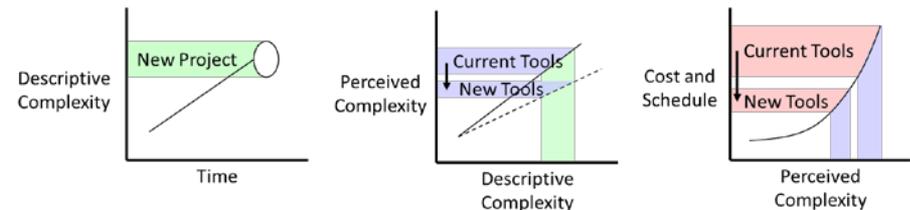

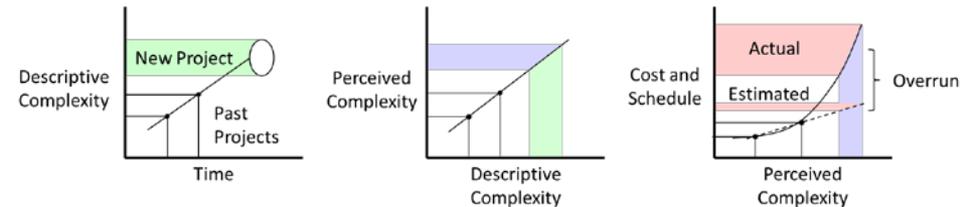

META-Enablers Sensitivity Analysis is very revealing !

Comparison of B777 EPS Program (actual vs. META)

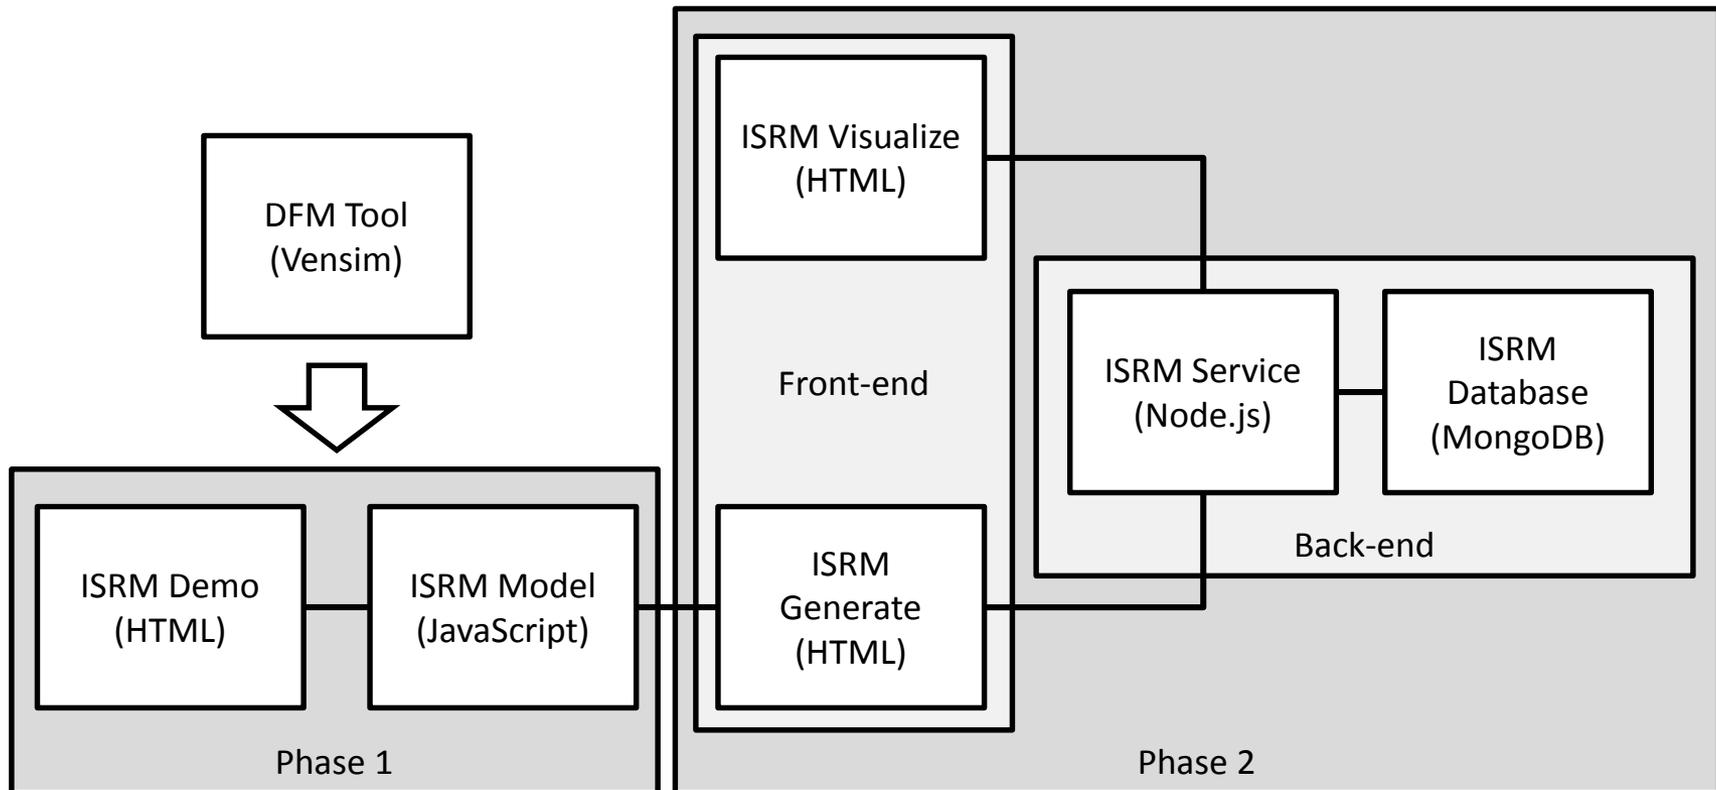

- DARPA META II program background
 - Study to avoid effort overruns on complex projects
 - Methods evaluated in Design Flow Model (de Weck, 2012)
 - System dynamics model of META-enabled project flow
 - Reqs → Exploration → Specs → Verification → Validation
 - Illustrates 5X speed-up for META-enabled projects
- ISRM extends DFM to add rapid sensitivity analysis
 - New tool to generate, collect, and visualize large data sets
 - DFM is a use case for new model-based methods
 - Generate new insights for DFM results
 - No additional model refinement or validation
- Approach: loosely-coupled browser-based modules

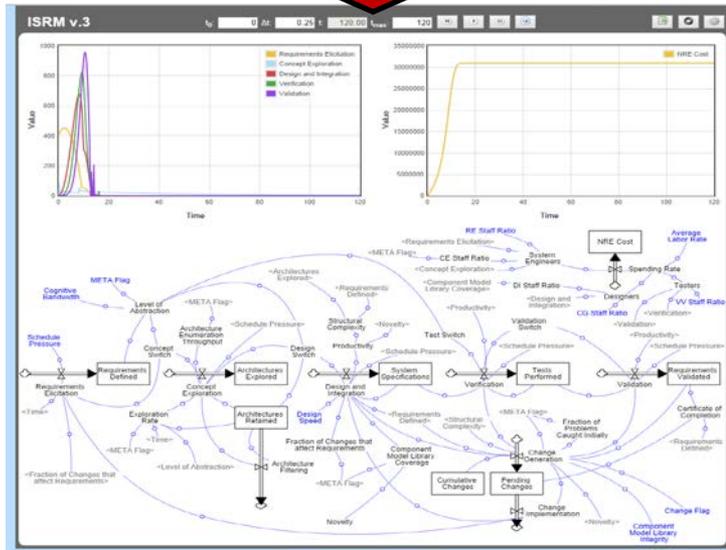

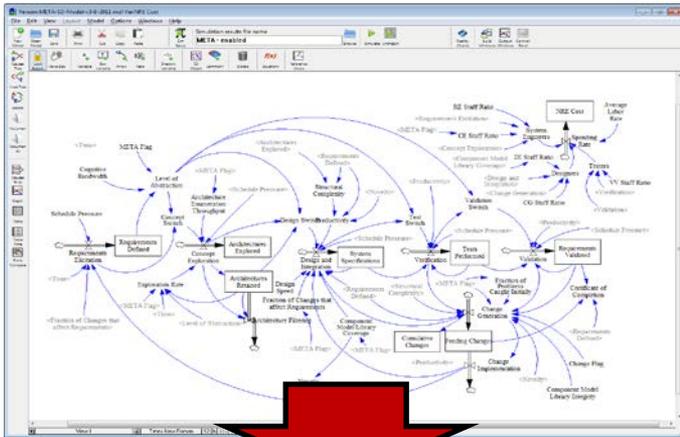

ISRM develops browser-based methods to rapidly analyze output datasets from a model of product development

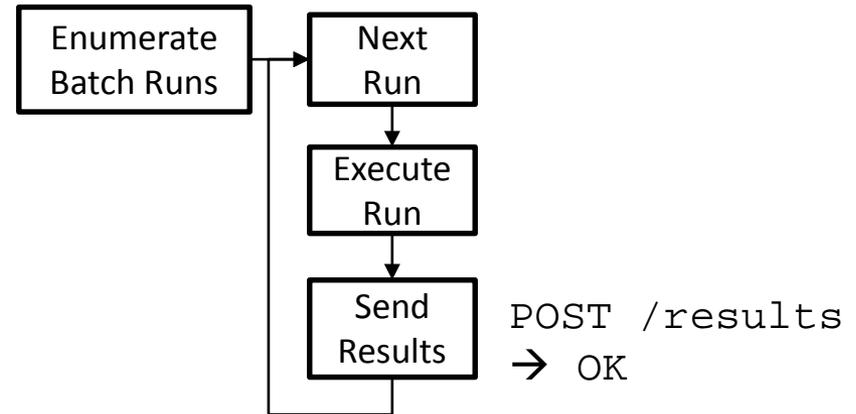

- Phase 1: demonstrate browser-based tool
- Phase 2: develop services for sensitivity analysis

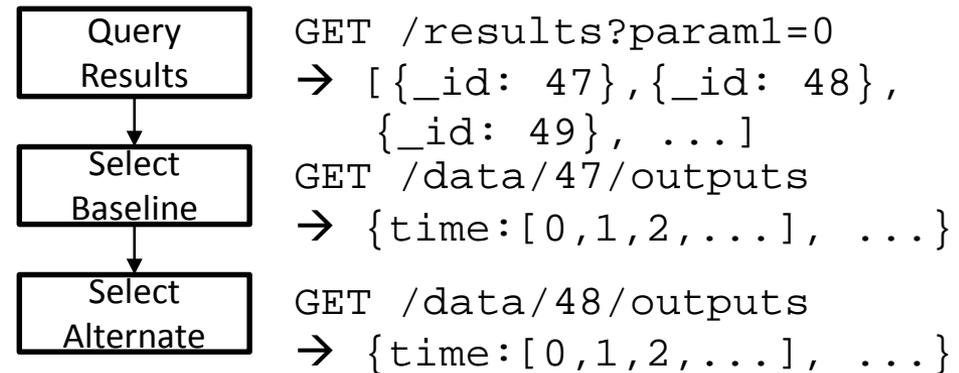

Phase 1 replicates the model in a browser environment, and Phase 2 creates services to generate, collect, and visualize data

Process to generate/store data in batches

Process to query data sets (visualization input)

Back-end services collect, store, and query data across executions and front-end interfaces control batch executions and visualize aggregated data

The existing model is ported to JavaScript and used in an interactive web page to control and view single executions

Key Findings

- Vensim results replicated
 - Non-optimized execution time: ~1 second
 - Output data ~100 kB
- Loose coupling effective
 - JavaScript + JSON as common language
 - Simple interfaces (GET/POST services)
- Sacrifice efficiency for accessibility and extensibility

Limitations

- Design Flow Model limited by assumptions
 - e.g. no staff constraint
 - Serves as example use case for development
- ISRM prototypes assume fixed model structure
 - Can vary parameter levels
 - Must manually edit source code to change structure

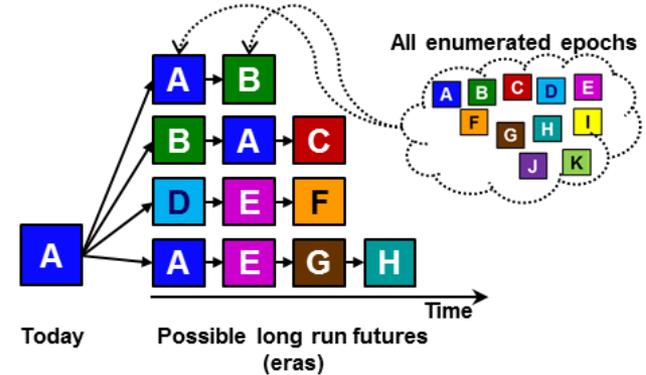

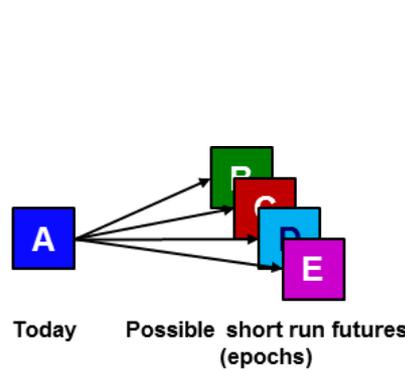

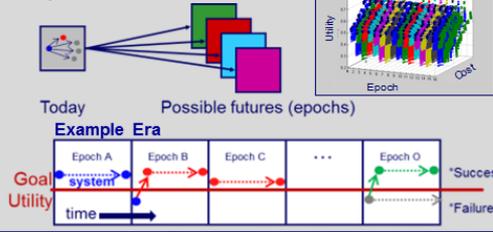

Note: this is currently a proof of concept demonstration capability

Web technologies provide a simple interface on a common platform but are slower than optimized tools
Future work aimed at schedule reduction may change the model structure to address known limitations

Epoch-Era Analysis (EEA)

Considering the impact of short run and long run context and needs changes on the success of systems

IED attacks in Iraq:
(Wired)

EEA is a framework that supports narrative and computational scenario planning and analysis for both short run and long run futures

- **Lead:** Dr. Adam M. Ross, Dr. Donna H. Rhodes
- **Summary:** Exploratory development of interactive Epoch-Era Analysis, including human interface and reasoning considerations for epoch and era characterizations, as well as single and multi- epoch/era analyses
- **Example Anticipated Outcomes:** Report, Papers, Proof of concept demo via mission planning support

Space Tug

Space Tug

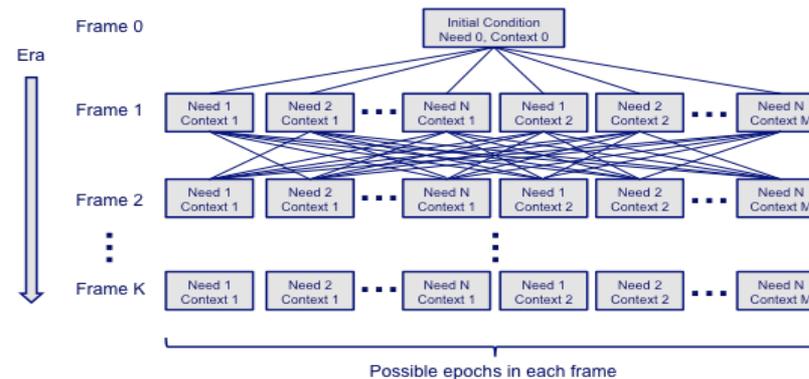

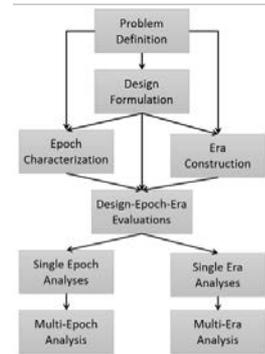

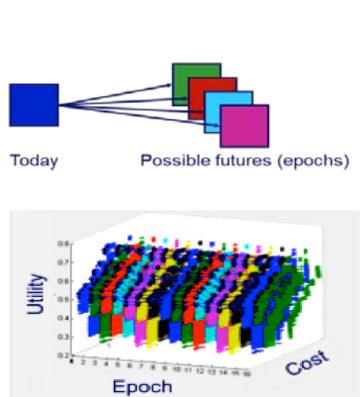

Eras

- > Sequence of epochs
 1. Demonstration
 2. Comsat Servicer
 3. Orbital Infrastructure
 4. Orbital Rescue

- IEEA will enable the elicitation of more broad/complete set of possible epochs.
 - Infrastructure that enables IEEA could include databases of epoch variables, which could be leveraged in future IEEA studies.
 - Explicit implementations in an interface will provide repeatable and more understandable elicitation experiences, resulting in more epoch variables.
- IEEA, through a human-in-the-loop implementation, will help to intelligently limit the potentially unbounded growth in the epoch/era space.
 - Using visual analytic techniques such as filtering, binning, pattern matching, search algorithms and human-in-the-loop interaction, IEEA can be used to effectively manage multi-epoch and multi-era analysis scale growth.
- IEEA will enable the development of superior intuition, buy-in, and insight generation for decision-making.
 - By allowing decision makers to “experience” (i.e. “see” and “interact with”) epochs and eras, they will better understand and accept the impact of context and needs changes on systems and therefore how resilience can be better achieved.

Interactivity and data persistence between studies will enable deeper data exploration, and facilitate the development of user skills for anticipatory thinking

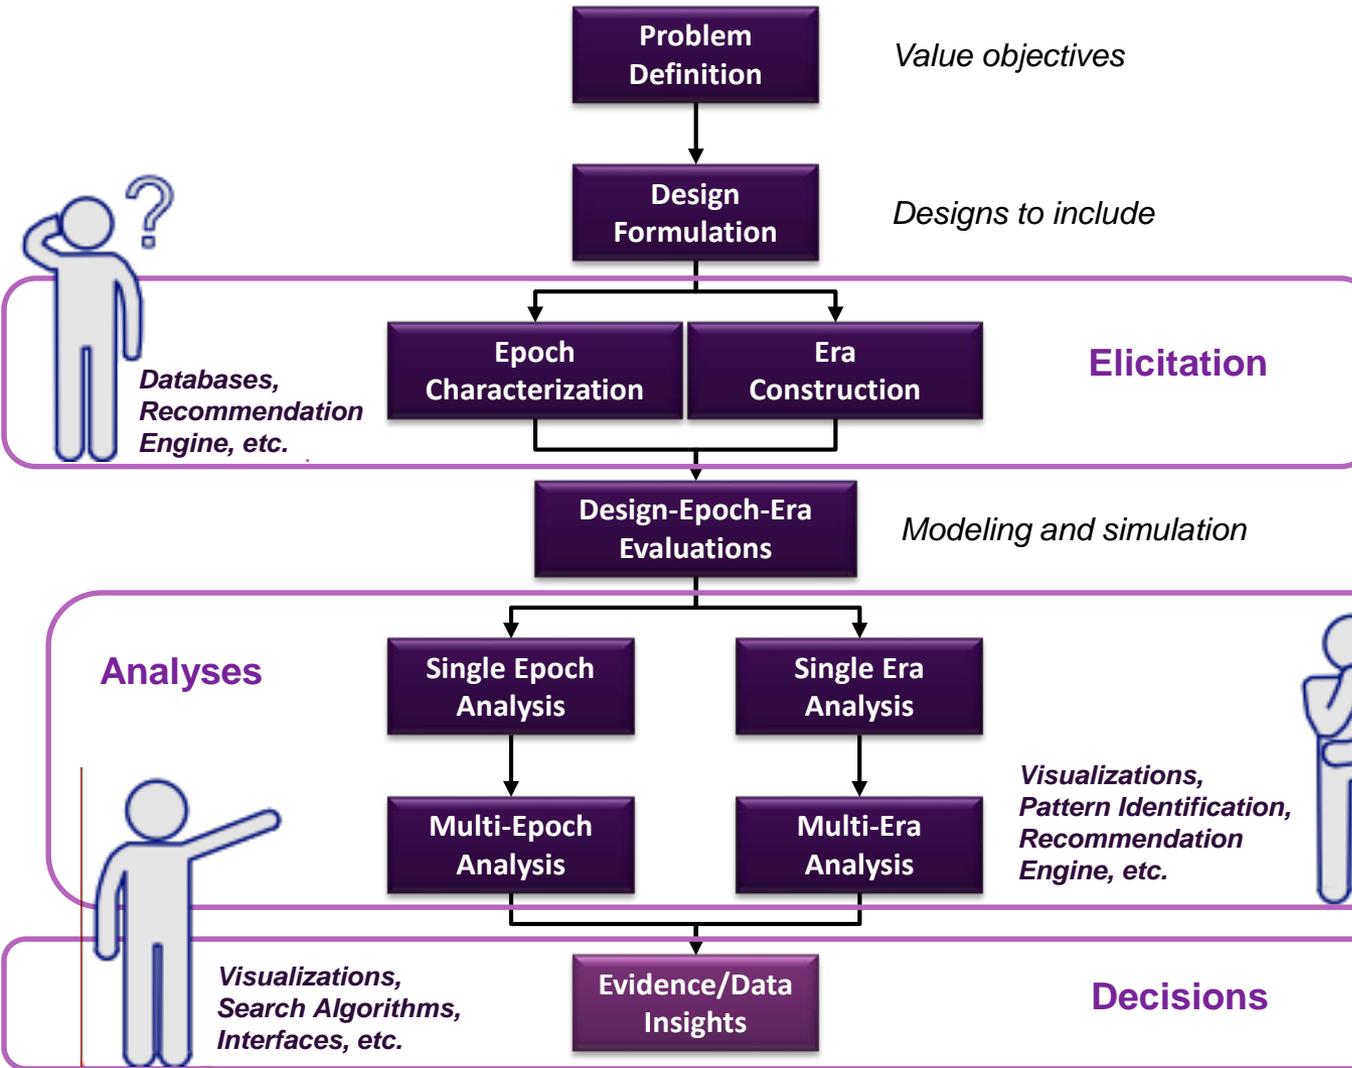

Challenges

- Data size increases which creates a storage and data transmission problem.
- Data size increase also creates a separate problem related to cross-filtering across large numbers of data dimensions. Human cognitive limitations make comprehension of high-dimensional data difficult so datasets must be “sliced” or cross-tabulated across dimensions before rendering them as 1D, 2D or 3D visualizations.
- Larger data sets require increased amounts of processing time to manipulate.
- Rendering problems arise when large amounts of data must be visualized simultaneously.

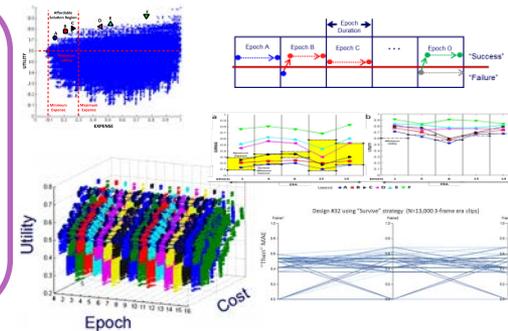

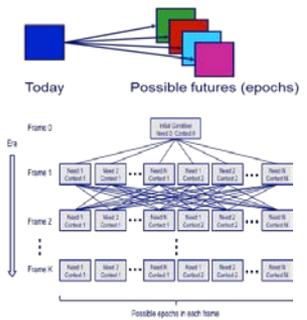

Enabling Research

- Data Reduction Methods
- Online Analytical Processing
- Human Interaction Methods
- Search Algorithms

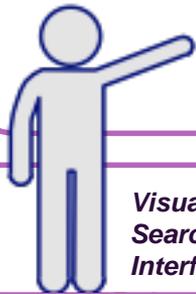

A Framework for Interactive Epoch-Era Analysis

Databases, Recommendation Engine, etc.

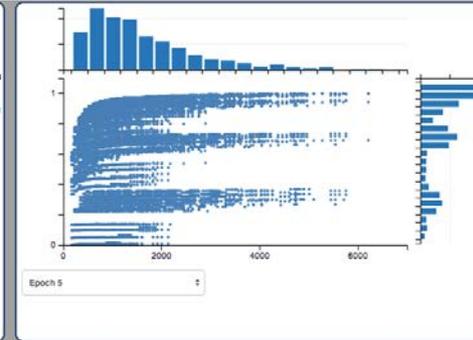

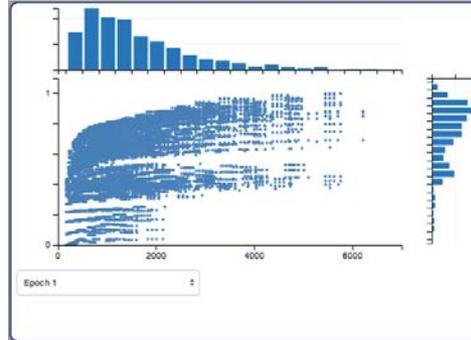

Visualizations, Pattern Identification, Recommendation Engine, etc.

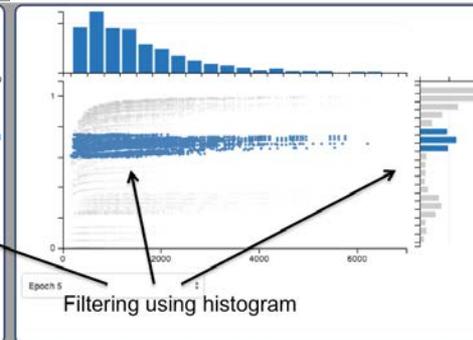

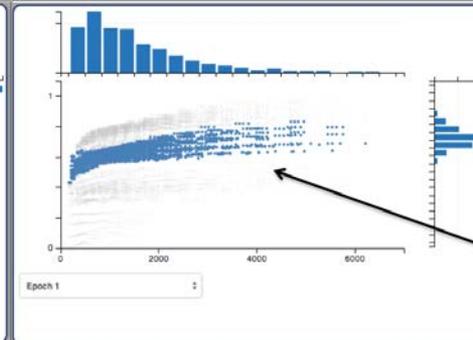

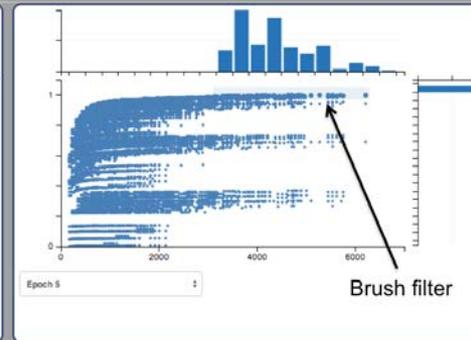

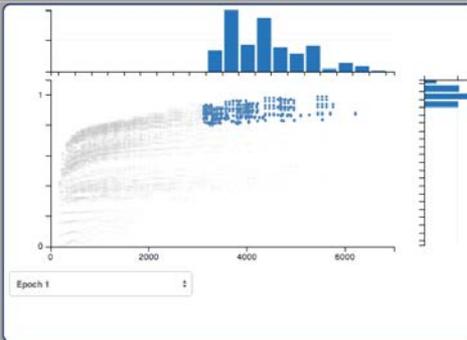

Visualizations, Search Algorithms, Interfaces, etc.

Thrusts with Supporting MPTs

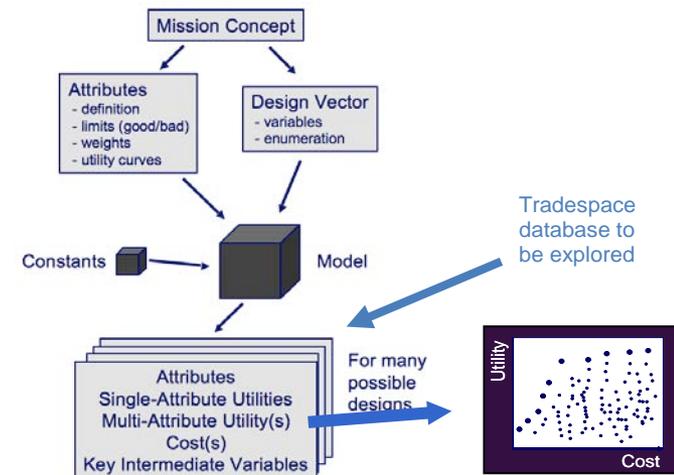

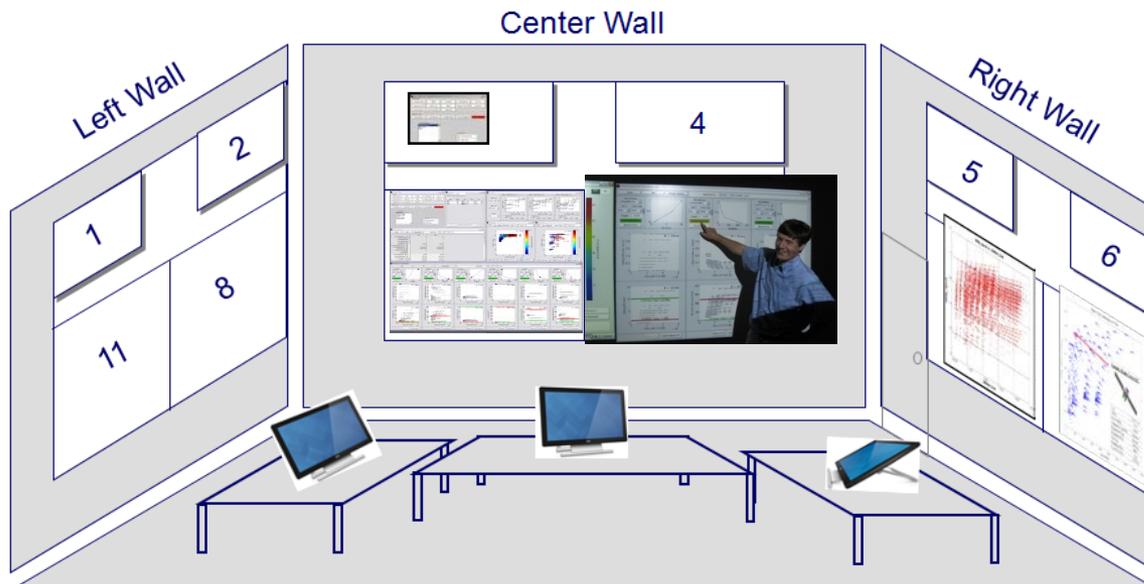

Supporting infrastructure to collate and synthesize demonstration software capabilities

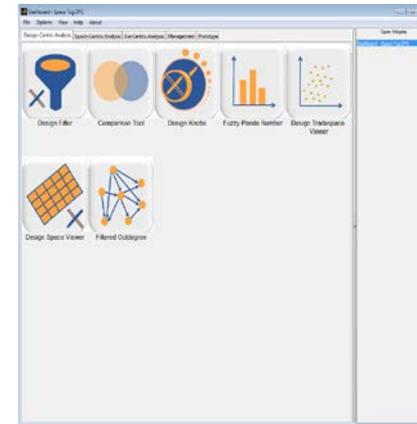

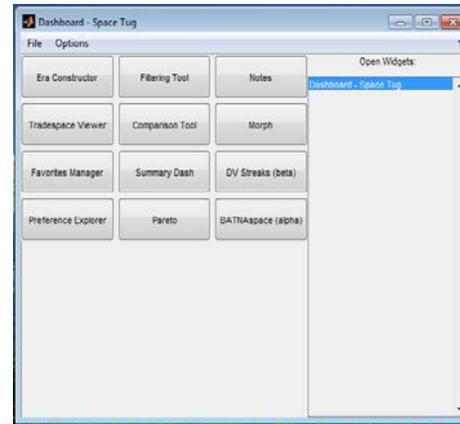

Moving beyond a technique used only by expert tradespace analysts...

A concept of operations for creating, using and sharing tradespace data with multiple, diverse decision makers

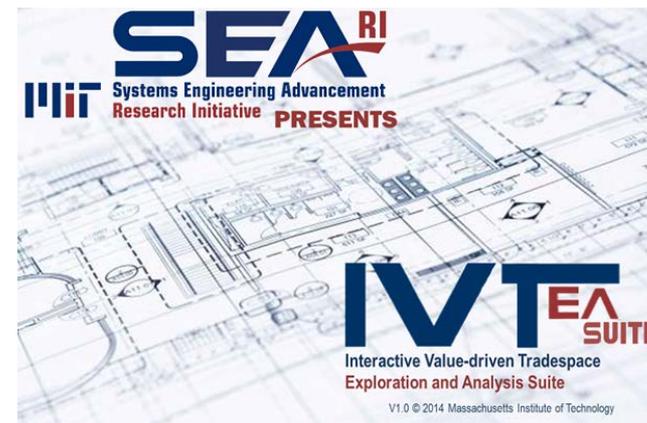

Development of a multi-sensory tradespace exploration lab (*research laboratory*)
 To address the shortcomings in sense-making of large dynamic tradespace data sets (IVTea Suite)

Rich data sets can be explored to reveal complex relationships between design-space and value-space for generating intuition into problem—a multi-dimensional analogy to graphing $y=f(x)$

Interactive Value-driven Tradespace Exploration and Analysis Suite

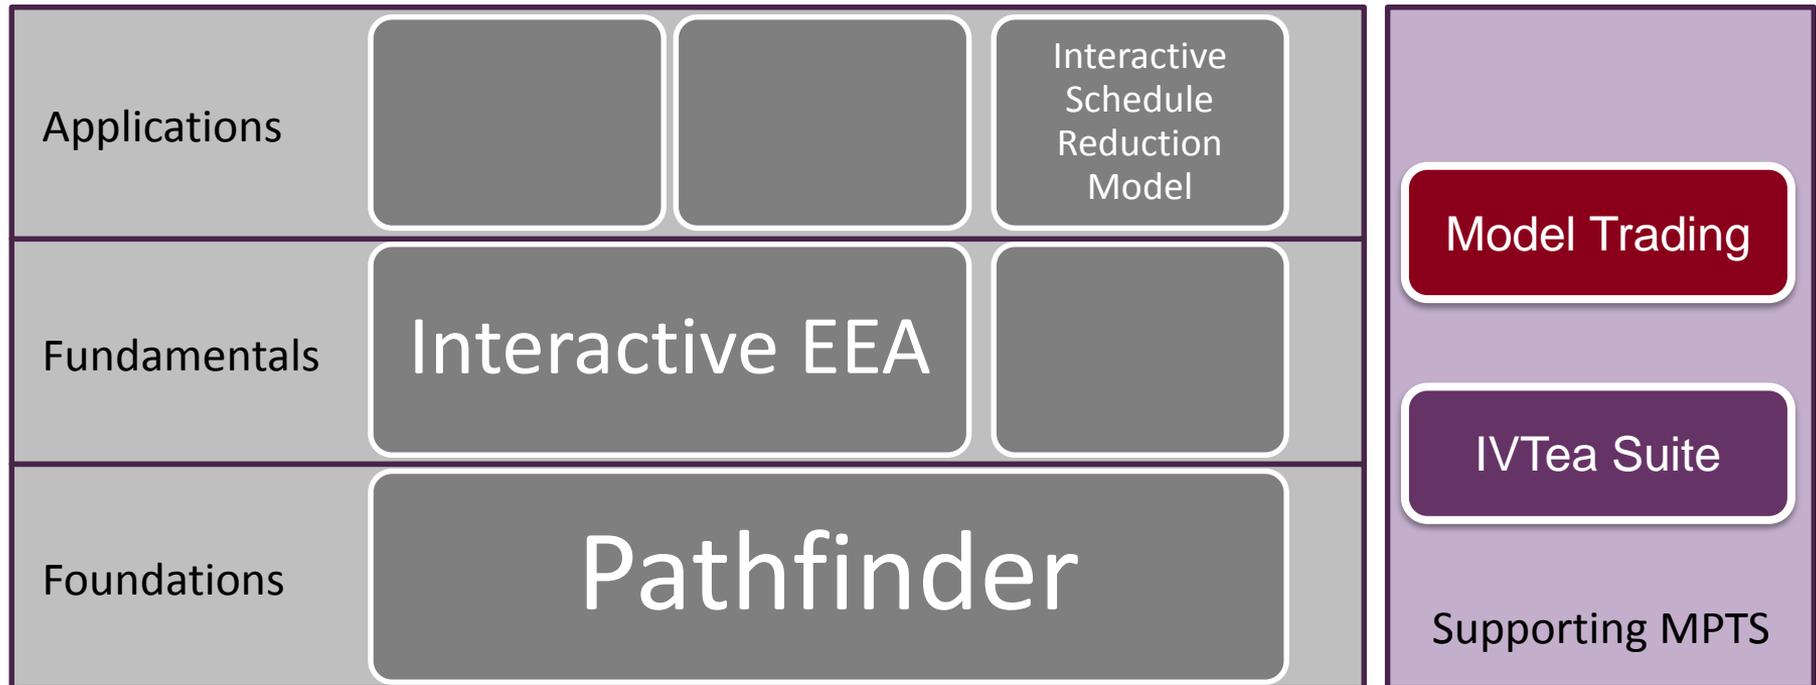

Design Space Viewer Filtered Outdegree Functions Fuzzy Pareto Number

Going forward, we're going to...

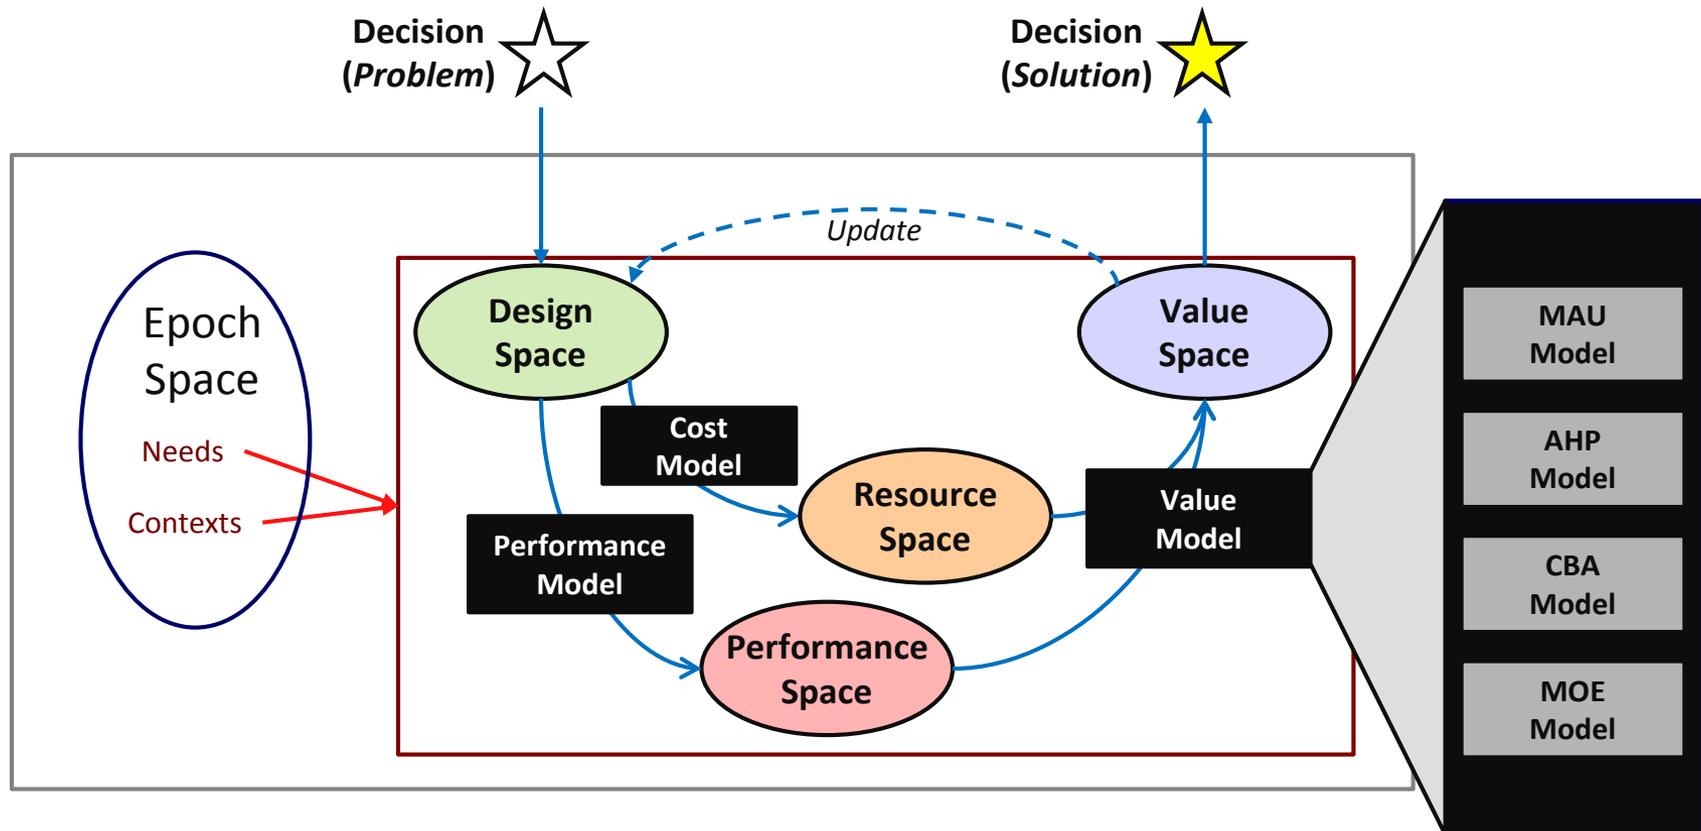

- Improve the IVTea Suite architecture to better reflect recent research advancements
- Investigate web-based implementations
- Incorporate interactive Epoch-Era Analysis
- Demonstrate the impact of value-model trades
- Investigate sharing IVTea Suite for exploratory use

Thrusts with Supporting MPTs

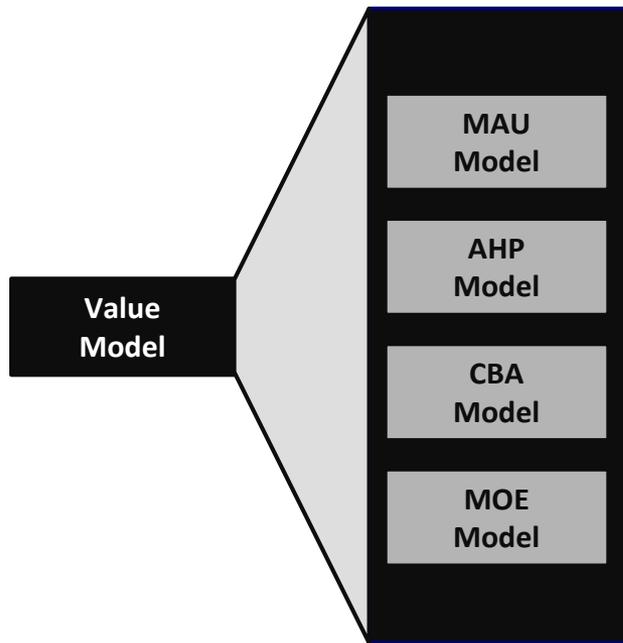

Enabling meta-thinking about the impact of model choice on decision support

Selection of Value Model is just as important as Performance Model and Cost Model

Ricci, N., Schaffner, M.A., Ross, A.M., Rhodes, D.H., and Fitzgerald, M.E., "Exploring Stakeholder Value Models Via Interactive Visualization," 12th Conference on Systems Engineering Research, Redondo Beach, CA, March 2014.

What if we had better understanding and trust in the implications of model choice?

$$U(\hat{X}) = \frac{[\prod_{i=1}^n (K \cdot k_i \cdot U_i(X_i) + 1)] - 1}{K}$$

$$K = -1 + \prod_{i=1}^n (K \cdot k_i + 1)$$

$$AHP(\hat{X}) = \sum_{i=1}^n k_i \cdot AHP_i(X_i)$$

$$AHP_i(X_i) = \frac{(X_i - X_{i,min})}{X_{i,max} - X_{i,min}}$$

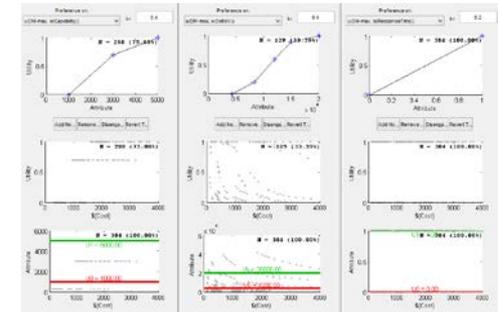

$$k_i = \frac{\sum_{q=1}^n a_{i,q}}{\sum_{p=1}^n a_{p,q}}$$

$$CBA(\hat{X}) = \sum_{i=1}^n CBA_i(X_i)$$

$$CBA_i(X_i) = \frac{m_i}{r_i} (1 - e^{-r_i \cdot X_i})$$

$$CBA_i(X_i) = 0$$

$$MOE(X_i) = X_i$$

	x(Capability)	x(DeltaV)	x(ResponseTime)
x(Capability)	1	1	2
x(DeltaV)	1	1	2
x(ResponseTime)	1/2	1/2	1

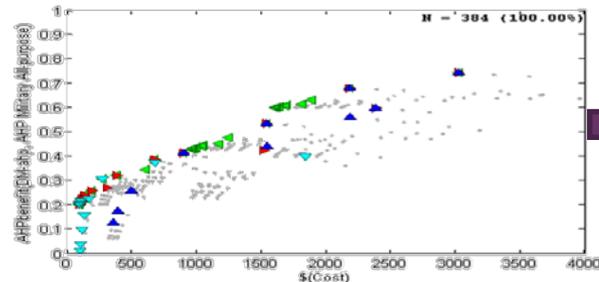

$X_i \geq X_{i,min}$

$X_i < X_{i,min}$

Model

CBA
Model

MOE
Model

Model comparisons and tradeoffs

Key points:

- 1) choice of value model determines the attractiveness of each solution;
- 2) each value model will likely highlight different systems;
- 3) can identify systems that do well across multiple value models;
- 4) analysis useful if value model choice is uncertain or likely to change.

"Best" design(s)

- Task 1: Pathfinder
 - Literature investigation into the four pillars
 - Three important challenges emerged and further investigation is ongoing
 - January workshop planned as first step in evolving the research agenda
- Task 2: Interactive Schedule Reduction Model (ISRM)
 - Demonstration web-based interactive model implementation
 - CSER15 paper: Grogan, P.T., de Weck, O.L., Ross, A.M., and Rhodes, D.H., “Interactive Models as a System Design Tool: Applications to System Project Management,” 13th Conference on Systems Engineering Research, Hoboken, NJ, Mar 2015.
- Task 3: Interactive Epoch-Era Analysis (IEEA)
 - Enabling technology prototypes
 - Storyboarding prototypes
 - CSER15 paper: Curry, M. and Ross, A.M., “Considerations for an Extended Framework for Interactive Epoch-Era Analysis,” 13th Conference on Systems Engineering Research, Hoboken, NJ, Mar. 2015.
- MPTs: Model Tradeoffs
 - Demonstration case study (value model tradeoff)
 - CSER15 paper: Ross, A.M., Rhodes, D.H., and Fitzgerald, M.E, “Interactive Value Model Trading for Resilient Systems Decisions,” 13th Conference on Systems Engineering Research, Hoboken, NJ, Mar. 2015.
- MPTs: IVTea Suite
 - Early v0.1 implemented in MATLAB
 - Preliminary rearchitecting effort

IMCSE Phase 1 Technical Report (September 30, 2014)

<http://www.sercuarc.org/wp-content/uploads/2014/05/SERC-RT-122-Phase-I-Technical-Report-2014-TR-048-1-20140930.pdf>

What are the semantic fields that span the general set of ilities?
e.g. “change-type”, “architecture-type”, “new ability-type”

Prescriptive Semantic Basis for Change-type Ilities

In response to “cause” in “context”, desire “agent” to make some “change” in “system” that is “valuable”

Cause	Context	Phase	Agent	Impetus Change				System	Outcome Change				System	Valuable			
-------	---------	-------	-------	----------------	--	--	--	--------	----------------	--	--	--	--------	----------	--	--	--

In response to “perturbation” in “context” during “phase” desire “agent” to make some “nature” impetus to the design “parameter” with “destination(s)” in the “aspect” to have an “effect” to the outcome “parameter” with “destination(s)” in the “aspect” of the “abstraction” that are valuable with respect to thresholds in “reaction”, “span”, “cost” and “benefits”

Perturbation	Context	Phase	Agent	Impetus				Outcome				Abstraction	Reaction	Span	Cost	Benefit
				Nature	Parameter	Destination	Aspect	Effect	Parameter	Destination	Aspect		threshold	threshold	threshold	threshold
				parameter	state				parameter	state			threshold	threshold	threshold	threshold

1 2 3 4 5 6 7 8 9 10 11 12 13 14

Basis

Generated ility “labels”

Derived ility “hierarchies”

We do not want more definitions, but rather, unambiguous, verifiable, standardized representations of desired system properties

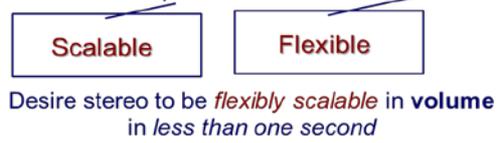

Ultimate Goal: develop the basis/bases to be a prescriptive instrument(s) for spanning the semantic fields whose union encompass all “ilities”

Prescriptive Semantic Basis for Change-type Ilities																				
In response to "perturbation" in "context", desire "agent" to make some "change" in "system" that is "valuable"																				
Perturbation	Context	Phase	Agent	Impetus Change					Mech	Outcome Change					System	Valuable* (this category is not complete)				
In response to "perturbation" in "context" during "phase" desire "agent" to make some "nature" impetus to the system "parameter" from "origin(s)" to "destination(s)" in the "aspect" using "mechanism" in order to have an "effect" to the outcome "parameter" from "origin(s)" to "destination(s)" in the "aspect" of the "abstraction" that are valuable with respect to thresholds in "reaction", "span", "cost" and "benefits"																				
Perturbation	Context	Phase	Agent	Impetus* (optional)					Mech	Outcome					Abstraction	Reaction	Span	Cost	Benefit

Back up

- Port DFM to JavaScript
 - Accessible source code
 - Extensible platform
 - Validate vs. Vensim

- Demonstrate browser-based tool
 - View model structure
 - Edit parameters and execute model
 - Visualize outputs

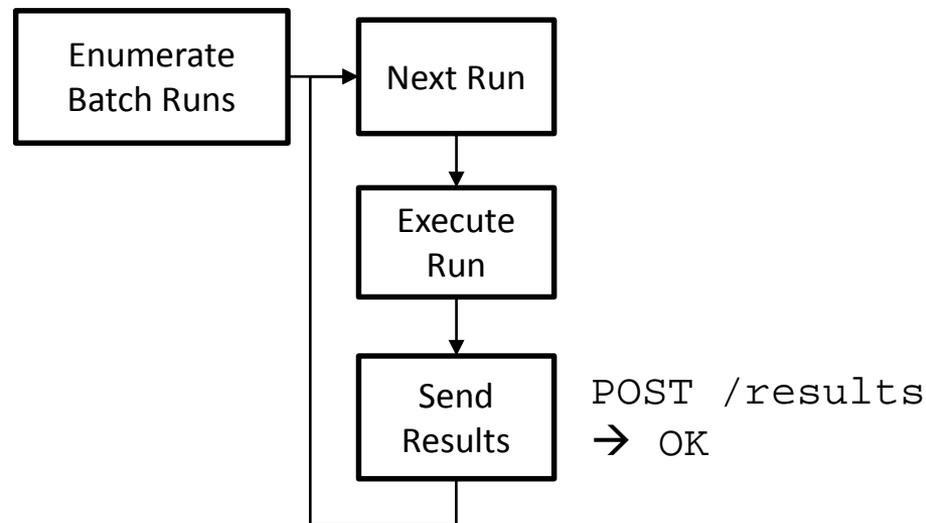

The existing model is ported to JavaScript and used in an interactive web page to control and view single executions

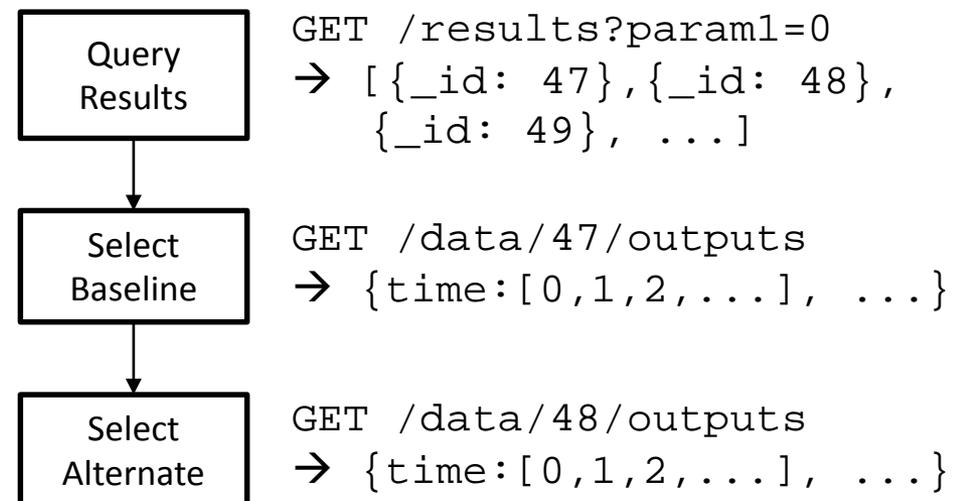

- Back-end services
 - POST output data
 - GET results matching query parameters
 - GET data for result

- Front-end interfaces
 - Generate data (batch)
 - Visualize data
 - Compare outputs
 - Tornado diagram
 - Tradespace diagram

Process to generate/store data in batches

Process to query data sets (visualization input)

Back-end services collect, store, and query data across executions and front-end interfaces control batch executions and visualize aggregated data
