

Sebastian Völkl is the co-founder and CEO of [Dalus](#), a San Francisco-based company building an AI-native systems engineering platform on SysML v2.

Dalus is used by government organizations, national labs, and hardware engineering teams in aerospace, defense, robotics, and automotive to manage requirements, architecture, verification, and safety analysis either On-Prem or in a cloud-native model, with an AI copilot and an open MCP interface connecting the model to the rest of the engineering toolchain.

It is also free for students and universities and is used at more than 30 institutions across the US, Europe, and Australia.
